

## High voltage converter

Datasheet - production data

### Applications

- Auxiliary SMPS for:
  - home appliances
  - consumer goods
  - industrial
  - lighting

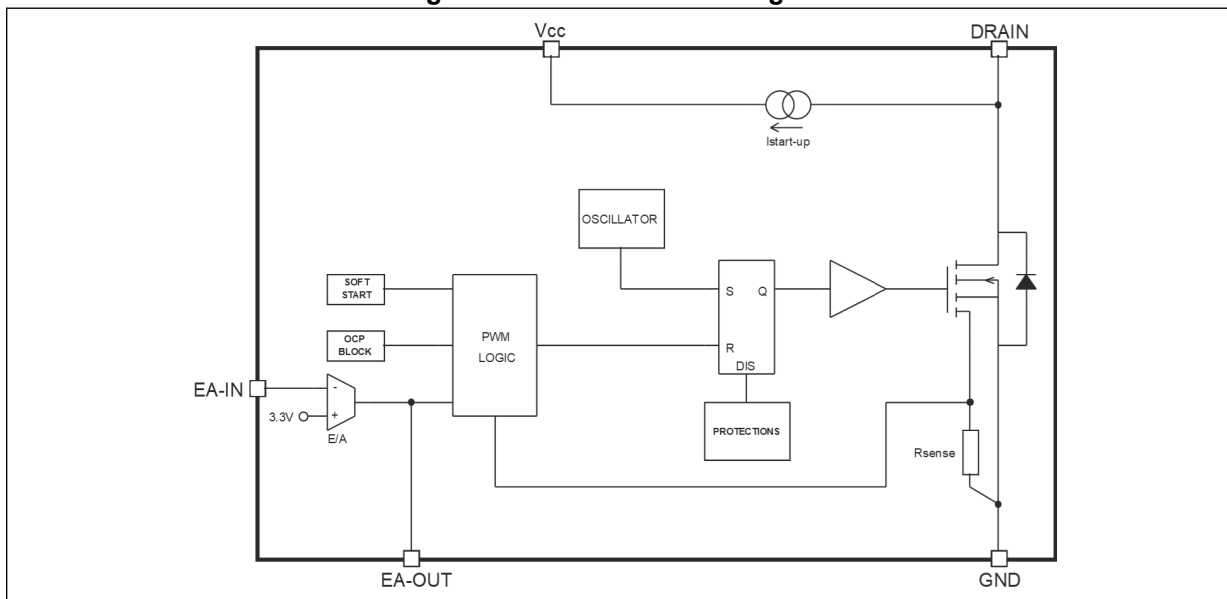

### Description

The device is a high performance high voltage converter that combines a 730 V rugged power MOSFET with PWM control. The device embeds high voltage startup and current sense circuitry, which helps reduce the number of components in a BoM. Frequency jittering spreads the EMI and allows the use of a smaller filter. The burst mode feature provides very low input power consumption at light loads.

### Features

- 730 V avalanche rugged power MOSFET
- PWM controller
- 3.3 V reference voltage
- Frequency jittering
- 40 mW no load input power at 230 V<sub>AC</sub>
- Short-circuit protection
- Thermal shutdown

# 1 Pin settings

Figure 2. Connection diagram

Table 1. Pin descriptions

SSOP10	Name	Function
1	GND	Connected to the source of the internal power MOSFET and controller ground reference.
2	VCC	Supply voltage of the control section. This pin provides the charging current of the external capacitor.
3	NC	Not connected. The pin must be left floating.
4	EA-OUT	Output of the error amplifier.
5	EA-IN	Input of the error amplifier.
6-10	DRAIN	High voltage drain pin. The built-in high voltage switched start-up bias current is drawn from this pin too. Connect to a PCB copper area to facilitate heat dissipation.

## 2 Typical power capability

Table 2. Typical power

$V_{IN}: 230 V_{AC}$		$V_{IN}: 85 - 265 V_{AC}$	
Adapter <sup>(1)</sup>	Open frame <sup>(2)</sup>	Adapter <sup>(1)</sup>	Open frame <sup>(2)</sup>
9 W	11 W	5 W	6 W

1. Typical continuous power in non-ventilated enclosed adapter measured at 50 °C ambient temperature.
2. Maximum practical continuous power in an open frame design at 50 °C ambient temperature, with adequate heat-sinking.

### 3 Electrical and thermal ratings

**Table 3. Absolute maximum rating**

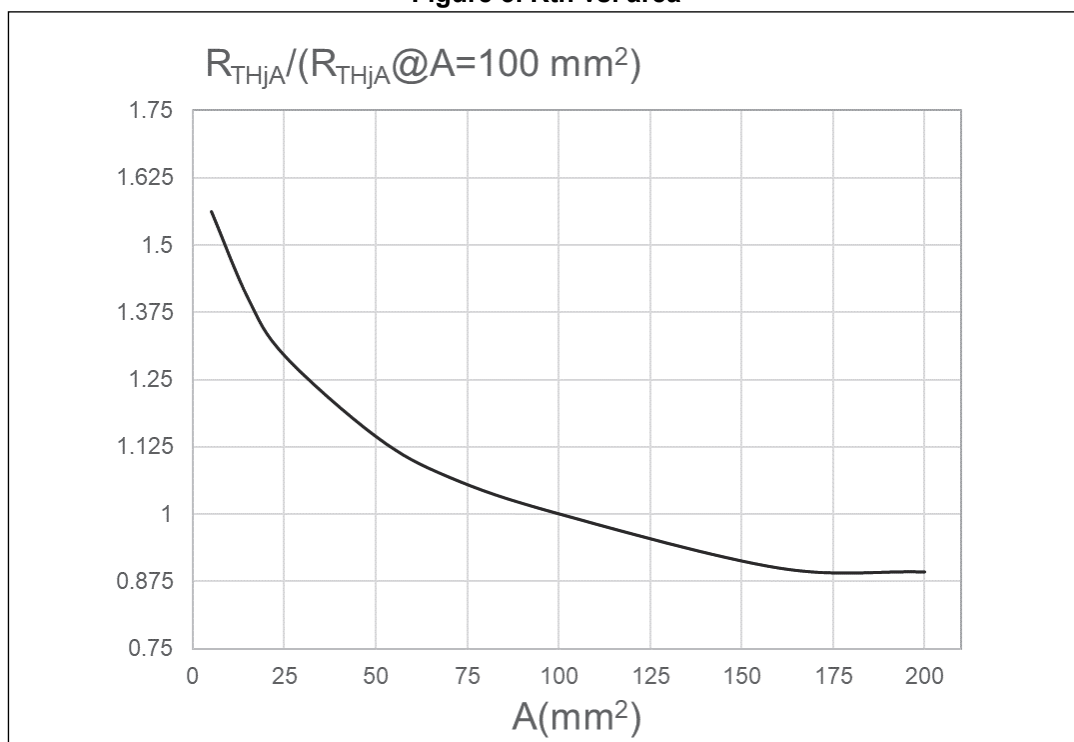

Symbol	Pin	Parameter	Value		Unit
			Min.	Max.	
$V_{DS}$	6-10	Drain-to-source (ground) voltage	-	730	V
$I_D$	6-10	Pulse drain current (limited by $T_J = 150\text{ °C}$ )	-	2	A
$V_{EA-IN}$	5	Input pin voltage	-0.3	4.8	V
$V_{EA-OUT}$	4	Out pin voltage	-0.3	3.5	V
$V_{CC}$	2	Supply voltage	-0.3	Self limited	V
$I_{CC}$	2	Input current	-	20	mA
$P_{TOT}$	-	Power dissipation at $T_A < 50\text{ °C}$	-	1	W
$T_J$	-	Junction temperature range	-40	150	°C
$T_{STG}$	-	Storage temperature	-55	150	°C

**Table 4. Thermal data**

Symbol	Parameter	Max. value	Unit
$R_{TH-JC}$	Thermal resistance junction to case <sup>(1)</sup> (Dissipated power = 1 W)	10	°C/W
$R_{TH-JA}$	Thermal resistance junction ambient <sup>(1)</sup> (Dissipated power = 1 W)	155	°C/W
$R_{TH-JC}$	Thermal resistance junction to case <sup>(2)</sup> (Dissipated power = 1 W)	5	°C/W
$R_{TH-JA}$	Thermal resistance junction ambient <sup>(2)</sup> (Dissipated power = 1 W)	95	°C/W

1. When mounted on a standard single side FR4 board with minimum copper area.
2. When mounted on a standard single side FR4 board with 100 mm<sup>2</sup> (0.155 sq in) of Cu (35 μm thick).

## 6 General description

The VIPER122 is a 730 V high voltage converter optimized for flyback and buck topologies that operates at 60 kHz switching frequency and integrates jittering in order to reduce EMI levels.

The low IC consumption combined with Burst Mode allows very low input power at no load and very good efficiency at light load.

### 6.1 Startup

On initial startup, the integrated high voltage current source charges the VCC capacitor. The charge current  $I_{CH1}$  is stopped as soon as the VCC voltage reaches  $V_{ON}$ .

As soon as the VCC capacitor is charged up to the  $V_{ON}$  threshold, the power MOSFET starts switching in soft-start mode and the device is either supplied from an external source (auxiliary winding or directly from the output voltage through a diode) or internally from the high voltage startup that is reactivated whenever the VCC voltage drops to the VCCL level.

Soft-start is staggered over 16 steps up to the default current limit value ( $I_{LIM}$ ), over a period of 8.5 ms.

In case of fault detection, the VCC voltage moves between  $V_{ON}$  (13 V) and  $V_{CCL}$  (10.5 V) and power MOSFET switching is only interrupted if the VCC voltage falls below the UVLO ( $V_{OFF}$ ) threshold, which typically occurs if the DRAIN voltage is removed.

### 6.2 Feedback loop

The device operates in current mode, so the primary current is internally sensed and converted into voltage that is applied to the non-inverting pin of the PWM comparator. The sensed voltage is compared through a voltage divider on a cycle-by-cycle basis with the voltage on the EA-IN pin.

The OCP comparator works in parallel with the PWM comparator and limits the primary current below the  $I_{LIM}$  threshold.

There are two ways to close the loop and regulate the output: through a resistor divider or an optocoupler.

#### 6.2.1 Resistor divider

For non-isolated topologies (flyback, buck or buck-boost converters), the output voltage can be directly regulated by connecting a resistor divider to the EA-IN pin that is the inverting input of the integrated error amplifier (EA).

Primary side regulation can be achieved by connecting the resistor divider from the auxiliary winding of the transformer to the EA-IN pin.

The loop compensation network is connected on the EA-OUT pin.

### 6.2.2 Optocoupler

For an isolated flyback, the EA-IN pin must be connected to ground and the optocoupler connected to the EA-OUT pin.

The EA-OUT pin dynamics range between the values  $V_{EA-SAT}$  and  $V_{EA-BM}$ : above the  $V_{EA-SAT}$  level, the primary drain current reaches its limit; below the  $V_{EA-BM}$  level, the device enters Burst Mode.

### 6.3 Burst mode at light load

When the load decreases, the feedback loop reacts by lowering the EA-OUT pin voltage. If it falls below the  $V_{EA-BM}$  threshold, power MOSFET switching is interrupted until it returns above  $V_{EA-BM} + V_{HYST}$ .

During Burst Mode, the drain current peak is clamped to about 85 mA in order to avoid audible noise due to the low switching frequency.

### 6.4 Short-circuit protection

The protection for a short-circuit is only tripped if the event persists for 50 ms. If the protection is tripped, the device stops switching for 1 second and then restarts automatically.

### 6.5 VCC clamp protection

A fault condition is detected if both of the following conditions are verified:

1. The primary drain current reaches the  $I_{LIM}$  threshold value.
2. The clamp current injected on the VCC pin reaches the  $I_{CC\_FAIL}$  threshold value.

When the protection is tripped, the device stops switching for 1 second and then restarts automatically. The device is protected in case of failure of the feedback network.
